AC LABOR	
<b>Robot Dynamics &amp; Control</b>	
METR 4202: Advanced Control & <b>Robotics</b>	
Dr Surya Singh Lecture # 4	August 20, 2014
metr4202@itee.uq.edu.au http://robotics.itee.uq.edu.au/~metr4202/	

Schedule			
Week	Date	Lecture (W: 11:10-12:40, 24-402)	
1	30-Jul	Introduction	
2	6-Aug	Representing Position & Orientation & State (Frames, Transformation Matrices & Affine Transformations)	
3	13-Aug	Robot Kinematics (& Ekka Day)	
4	20-Aug	Robot Dynamics & Control	
5	27-Aug	Robot Trajectories & Motion	
6	3-Sep	Sensors & Measurement	
7	10-Sep	Perception (Computer Vision)	
8	17-Sep	Navigation & Localization (+ Prof. M. Srinivasan)	
9	24-Sep	Motion Planning + Control	
	1-Oct	Study break	
10	8-Oct	State-Space Modelling	
11	15-Oct	Shaping the Dynamic Response	
12	22-Oct	Linear Observers & LQR	
13	29-Oct	Applications in Industry & Course Review	
METR -	4202: <b>Robotics</b>	20 August 2014 - 2	

### **Inverse Kinematics**

- Inverse Kinematics is the problem of finding the joint parameters given only the values of the homogeneous transforms which model the mechanism (i.e., the pose of the end effector)
- Solves the problem of where to drive the joints in order to get the hand of an arm or the foot of a leg in the right place
- In general, this involves the solution of a set of simultaneous, non-linear equations
- Hard for serial mechanisms, easy for parallel

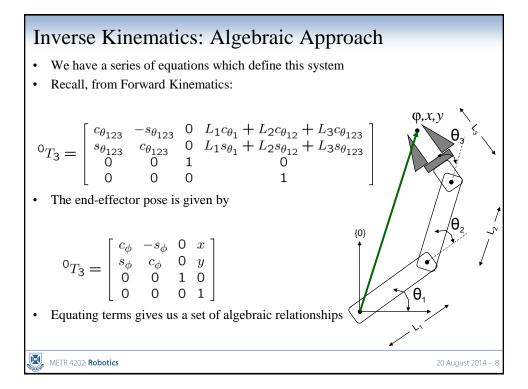

METR 4202: Robotics

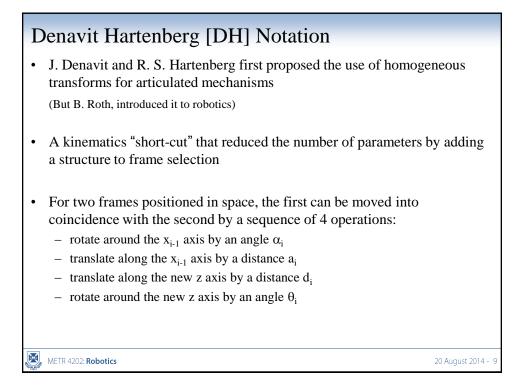

20 August 2014 - 6

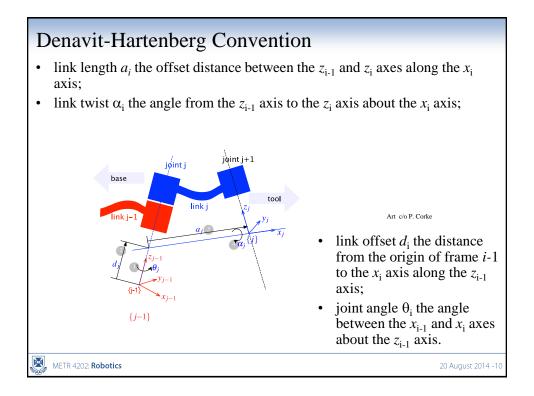

# Solution Methods

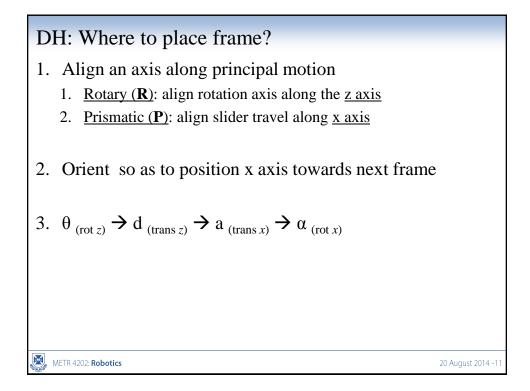

- Unlike with systems of linear equations, there are no general algorithms that may be employed to solve a set of nonlinear equation
- Closed-form and numerical methods exist
- We will concentrate on analytical, closed-form methods
- These can be characterized by two methods of obtaining a solution: **algebraic** and **geometric**

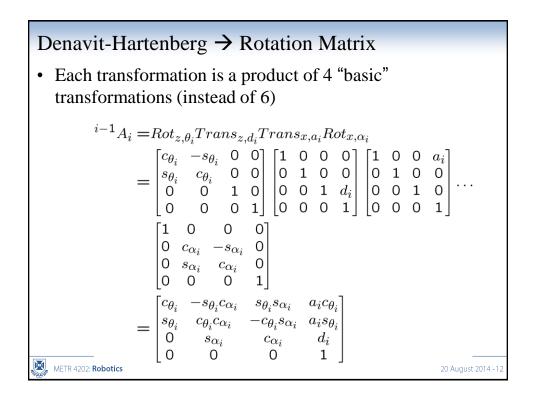

20 August 2014 -

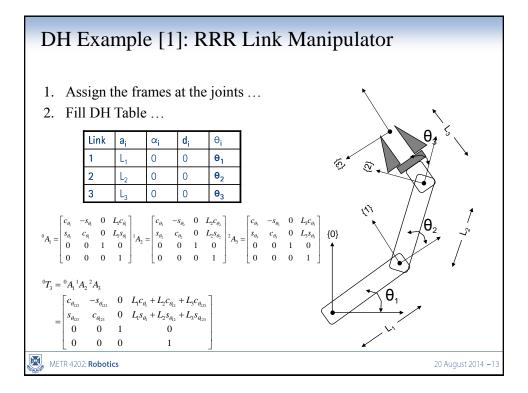

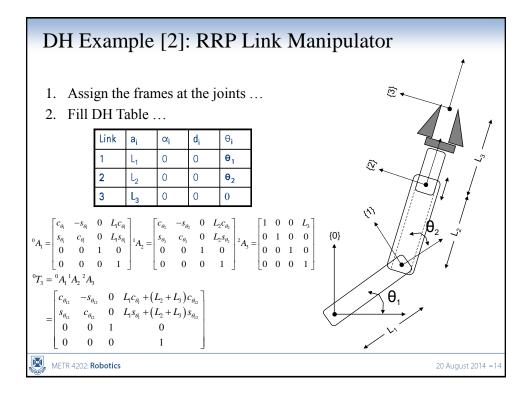

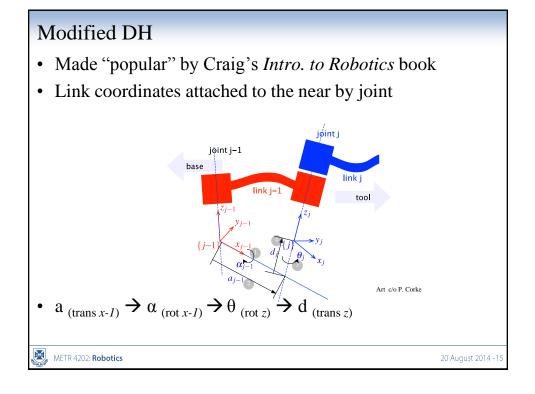

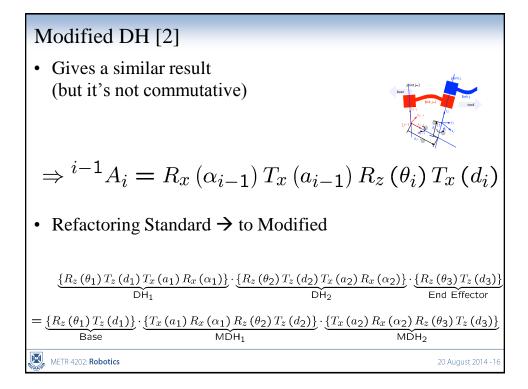

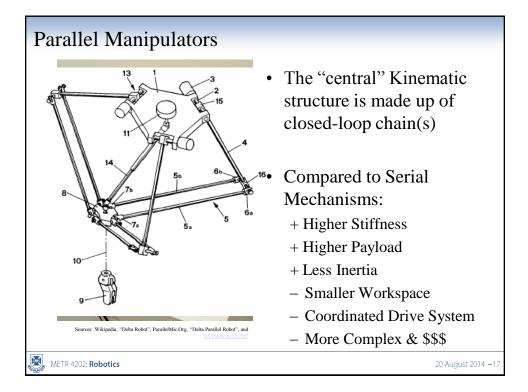

Symmetrical Parallel Manipulator
A sub-class of Parallel Manipulator:

# Limbs (m) = # DOF (F)
The joints are arranged in an identical pattern
The # and location of actuated joints are the same

Thus:

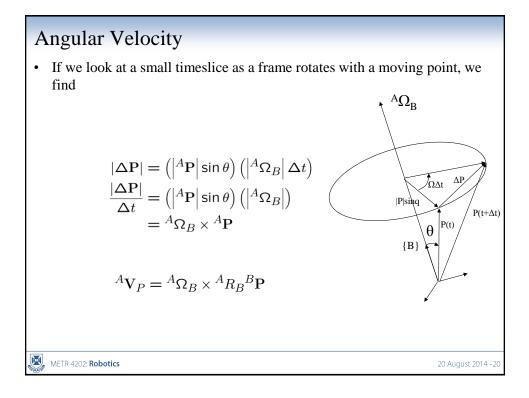

Number of Loops (L): One less than # of limbs
L = m - 1 = F - 1

Connectivity (C<sub>k</sub>)

m C<sub>k</sub> = (λ + 1) F - λ
k=1

Where λ: The DOF of the space that the system is in (e.g., λ=6 for 3D space).

# Velocity

• Recall that we can specify a point in one frame relative to another as

$${}^{A}\mathbf{P} = {}^{A}\mathbf{P}_{B} + {}^{A}_{B}\mathbf{R}^{B}\mathbf{P}$$

• Differentiating w/r/t to **t** we find

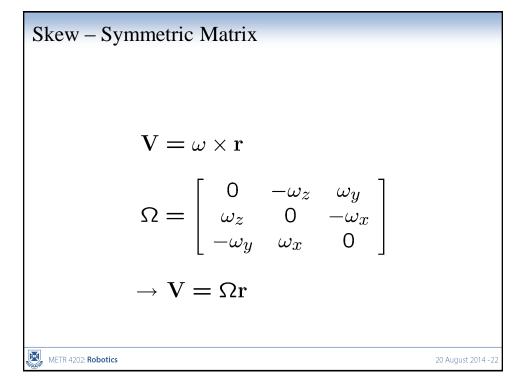

$${}^{A}\mathbf{V}_{P} = \frac{d}{dt}{}^{A}\mathbf{P} = \lim_{\Delta t \to 0} \frac{{}^{A}\mathbf{P}(t + \Delta t) - {}^{A}\mathbf{P}(t)}{\Delta t}$$
$$= {}^{A}\dot{\mathbf{P}}_{B} + {}^{A}_{B}\mathbf{R}^{B}\dot{\mathbf{P}} + {}^{A}_{B}\dot{\mathbf{R}}^{B}\mathbf{P}$$

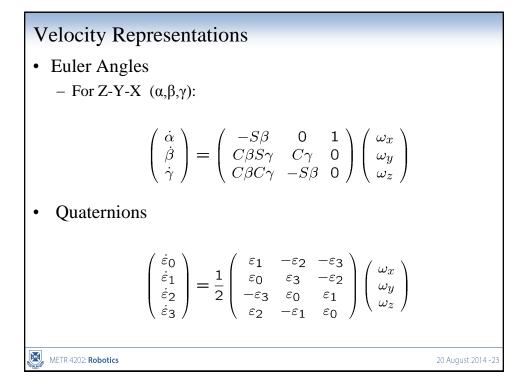

• This can be rewritten as

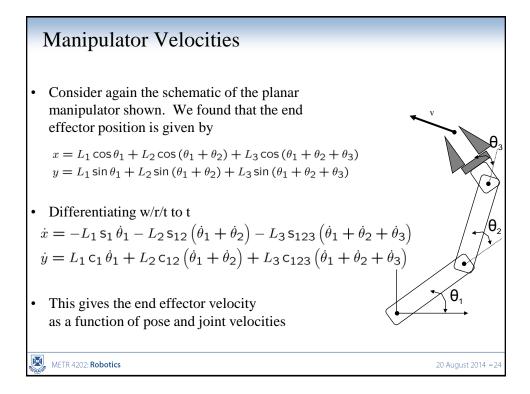

$${}^{A}\mathbf{V}_{P} = {}^{A}\mathbf{V}_{BORG} + {}^{A}\mathbf{R}_{B}{}^{B}\mathbf{V}_{P} + {}^{A}\Omega_{B} \times {}^{A}\mathbf{R}_{B}{}^{B}\mathbf{P}$$

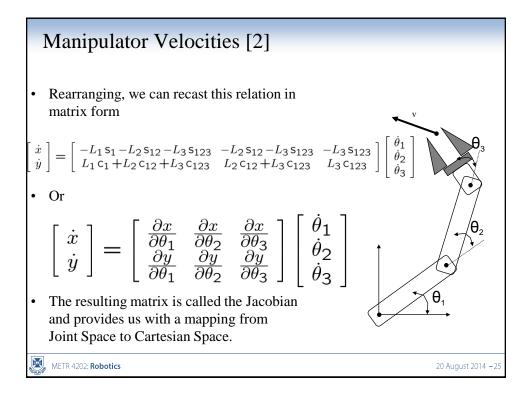

METR 4202: Robotics

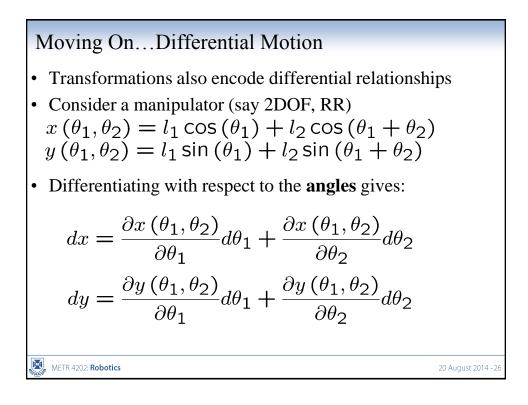

20 August 2014 - 21

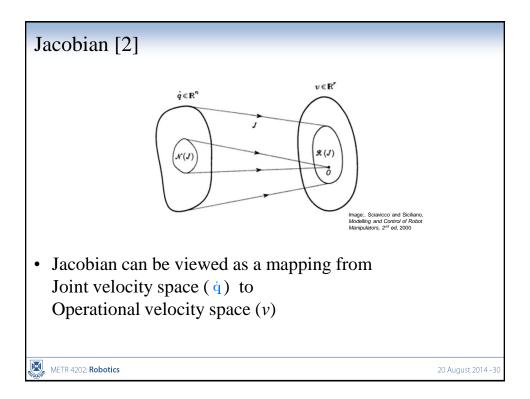

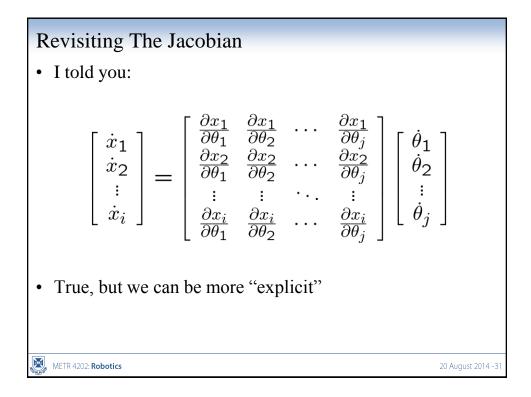

Differential Motion [2]  
• Viewing this as a matrix 
$$\rightarrow$$
 Jacobian  
 $d\mathbf{x} = Jd\theta$   
 $J = \begin{bmatrix} -l_1 \sin(\theta_1) - l_2 \sin(\theta_1 + \theta_2) & -l_2 \sin(\theta_1 + \theta_2) \\ l_1 \cos(\theta_1) + l_2 \cos(\theta_1 + \theta_2) & l_2 \cos(\theta_1 + \theta_2) \end{bmatrix}$   
 $J = \begin{bmatrix} [J_1] & [J_2] \end{bmatrix}$   
 $v = J_1\dot{\theta}_1 + J_2\dot{\theta}_2$ 

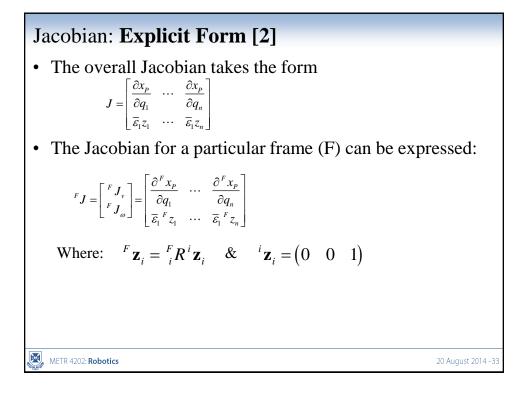

Infinitesimal Rotations •  $\cos(d\phi) = 1$ ,  $\sin(d\phi) = d\phi$   $R_x(d\phi) = \begin{bmatrix} 1 & 0 & 0 \\ 0 & cd\phi & -sd\phi \\ 0 & sd\phi & cd\phi \end{bmatrix} \approx \begin{bmatrix} 1 & 0 & 0 \\ 0 & 1 & -d\phi \\ 0 & d\phi & 1 \end{bmatrix}$   $R_y(d\phi) = \begin{bmatrix} cd\phi & 0 & sd\phi \\ 0 & 1 & 0 \\ -sd\phi & 0 & cd\phi \end{bmatrix} \approx \begin{bmatrix} 1 & 0 & d\phi \\ 0 & 1 & 0 \\ -d\phi & 0 & 1 \end{bmatrix}$   $R_z(d\phi) = \begin{bmatrix} cd\phi & -sd\phi & 0 \\ sd\phi & cd\phi & 0 \\ 0 & 0 & 1 \end{bmatrix} \approx \begin{bmatrix} 1 & -d\phi z & 0 \\ d\phi z & 1 & 0 \\ 0 & 0 & 1 \end{bmatrix}$ • Note that:  $R_x(d\phi)R_y(d\phi) = R_y(d\phi)R_x(d\phi)$  $\Rightarrow$  Therefore ... they <u>commute</u>

# The Jacobian • In general, the Jacobian takes the form (for example, <u>j joints</u> and in <u>i operational space</u>) $\begin{bmatrix} \dot{x}_1 \\ \dot{x}_2 \\ \vdots \\ \dot{x}_i \end{bmatrix} = \begin{bmatrix} \frac{\partial x_1}{\partial \theta_1} & \frac{\partial x_1}{\partial \theta_2} & \cdots & \frac{\partial x_1}{\partial \theta_j} \\ \frac{\partial x_2}{\partial \theta_1} & \frac{\partial x_2}{\partial \theta_2} & \cdots & \frac{\partial x_2}{\partial \theta_j} \\ \vdots & \vdots & \ddots & \vdots \\ \frac{\partial x_i}{\partial \theta_1} & \frac{\partial x_i}{\partial \theta_2} & \cdots & \frac{\partial x_i}{\partial \theta_j} \end{bmatrix} \begin{bmatrix} \dot{\theta}_1 \\ \dot{\theta}_2 \\ \vdots \\ \dot{\theta}_j \end{bmatrix}$ • Or more succinctly $\dot{\mathbf{X}} = \mathbf{J}(\theta)\dot{\theta}$

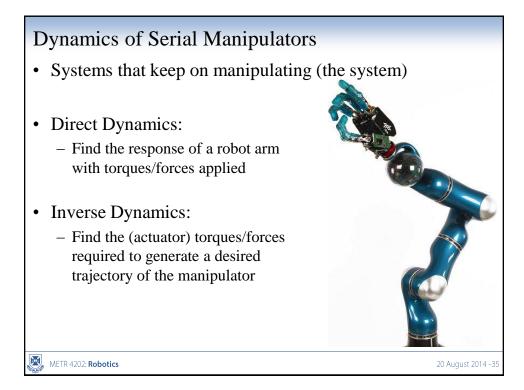

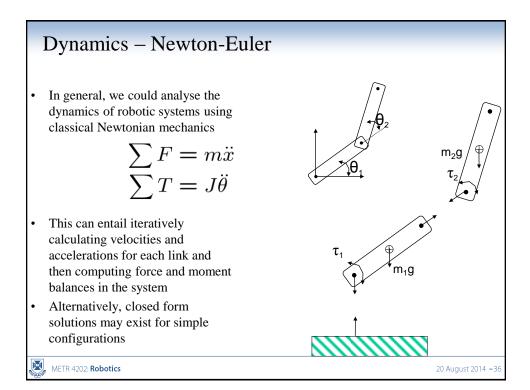

# Jacobian: Explicit Form • For a serial chain (robot): The velocity of a link with respect to the proceeding link is dependent on the type of link that connects them • If the joint is prismatic ( $\epsilon$ =1), then $\mathbf{v}_i = \frac{dz}{dt}$ • If the joint is revolute ( $\epsilon$ =0), then $\omega = \frac{d\theta}{dt}$ (in the $\hat{k}$ direction) $\therefore v = \sum_{i=1}^{N} (\varepsilon_i v_i + \overline{\varepsilon}_i (\omega_i \times \mathbf{p}_{i-1}^i)) \qquad \omega = \sum_{i=1}^{N} (\overline{\varepsilon}_i (\dot{\mathbf{e}}_i)) = \sum_{i=1}^{N} (\overline{\varepsilon}_i \mathbf{z}_i (\dot{\theta}_i))$ $\rightarrow v = J_v \dot{\mathbf{q}} \qquad \omega = J_\omega \dot{\mathbf{q}}$ • Combining them (with $\mathbf{v}$ =( $\Delta \mathbf{x}, \Delta \theta$ )) $J = \begin{bmatrix} J_v \\ J_\omega \end{bmatrix}$

# Dynamics

- We can also consider the forces that are required to achieve a particular motion of a manipulator or other body
- Understanding the way in which motion arises from torques applied by the actuators or from external forces allows us to control these motions
- There are a number of methods for formulating these equations, including
  - Newton-Euler Dynamics
  - Langrangian Mechanics

#### Dynamics

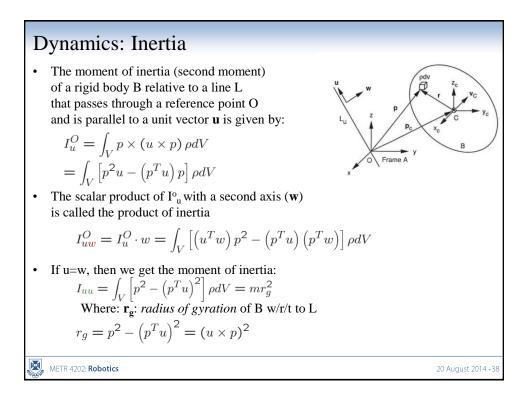

• For Manipulators, the general form is

 $\tau = M(\Theta)\ddot{\Theta} + V(\Theta, \dot{\Theta}) + G(\Theta)$ 

where

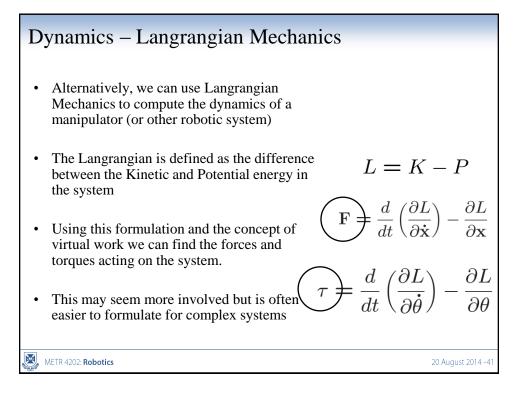

- $\tau$  is a vector of joint torques
- $\Theta$  is the nx1 vector of joint angles
- $M(\Theta)$  is the nxn mass matrix
- $V(\Theta, \Theta)$  is the nx1 vector of centrifugal and Coriolis terms
- $G(\Theta)$  is an nx1 vector of gravity terms
- Notice that all of these terms depend on  $\Theta$  so the dynamics varies as the manipulator move

20 August 2014 - 37

Dynamics: Mass Matrix • The Mass Matrix: Determining via the Jacobian!  $\kappa = \sum_{i=1}^{N} \kappa_{i}$   $K_{i} = \frac{1}{2} \left( m_{i} v_{C_{i}}^{T} v_{C_{i}} + \omega_{i}^{T} I_{C_{i}} \omega_{i} \right)$   $v_{C_{i}} = J_{v_{i}} \dot{\theta} \quad J_{v_{i}} = \begin{bmatrix} \frac{\partial p_{C_{1}}}{\partial \theta_{1}} & \cdots & \frac{\partial p_{C_{i}}}{\partial \theta_{i}} & \underbrace{0}_{i+1} & \cdots & \underbrace{0}_{n} \end{bmatrix}$   $\omega_{i} = J_{\omega_{i}} \dot{\theta} \quad J_{\omega_{i}} = \begin{bmatrix} \overline{\varepsilon}_{1} Z_{1} & \cdots & \overline{\varepsilon}_{i} Z_{i} & \underbrace{0}_{i+1} & \cdots & \underbrace{0}_{n} \end{bmatrix}$   $\therefore M = \sum_{i=1}^{N} \left( m_{i} J_{v_{i}}^{T} J_{v_{i}} + J_{\omega_{i}}^{T} I_{C_{i}} J_{\omega_{i}} \right)$ ! M is symmetric, positive definite  $\therefore m_{ij} = m_{ji}, \dot{\theta}^{T} M \dot{\theta} > 0$ 

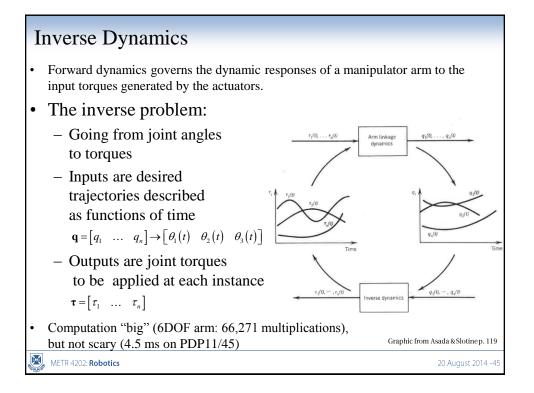

$$\begin{aligned} & \text{Dynamics} - \text{Langrangian Mechanics [2]} \\ & \text{L} = K - P, \dot{\theta}: \text{Generalized Velocities, } M : \text{Mass Matrix}} \\ & \tau = \sum_{i=1}^{N} \tau_i = \frac{d}{dt} \left( \frac{\partial K}{\partial \dot{\theta}} \right) - \frac{\partial K}{\partial \theta} + \frac{\partial P}{\partial \theta} \\ & K = \frac{1}{2} \dot{\theta}^T M\left(\theta\right) \dot{\theta} \\ & \frac{d}{dt} \left( \frac{\partial K}{\partial \dot{\theta}} \right) = \frac{d}{dt} \left( \frac{\partial}{\partial \dot{\theta}} \left( \frac{1}{2} \dot{\theta}^T M\left(\theta\right) \dot{\theta} \right) \right) = \frac{d}{dt} \left( M \dot{\theta} \right) = M \ddot{\theta} + \dot{M} \dot{\theta} \\ & \rightarrow \frac{d}{dt} \left( \frac{\partial K}{\partial \dot{\theta}} \right) - \frac{\partial K}{\partial \theta} = \left[ M \ddot{\theta} + \dot{M} \dot{\theta} \right] - \left[ \frac{1}{2} \dot{\theta}^T M\left(\theta\right) \dot{\theta} \right] = M \ddot{\theta} + \left\{ \underbrace{\dot{M} \dot{\theta} - \frac{1}{2} \left[ \begin{array}{c} \dot{\theta}^T \frac{\partial M}{\partial \theta_1} \dot{\theta} \\ \vdots \\ \dot{\theta}^T \frac{\partial M}{\partial \theta_n} \dot{\theta} \\ \end{array} \right\} \\ & \times \left( \theta, \dot{\theta} \right) = \frac{C\left(\theta\right) \left[ \dot{\theta}^2 \right]}{\text{Centrifugal}} + \underbrace{B\left(\theta\right) \left[ \dot{\theta} \dot{\theta} \right]}_{\text{Coriolis}} \\ & \Rightarrow \tau = M\left(\theta\right) \ddot{\theta} + \mathbf{v}\left(\theta, \dot{\theta}\right) + \mathbf{g}(\theta) \end{aligned} \end{aligned}$$

Dynamics – Langrangian Mechanics [3]  
• The Mass Matrix: Determining via the Jacobian!  

$$\begin{split} & \kappa = \sum_{i=1}^{N} \kappa_i \\ & K_i = \frac{1}{2} \left( m_i v_{C_i}^T v_{C_i} + \omega_i^T I_{C_i} \omega_i \right) \\ & v_{C_i} = J_{v_i} \dot{\theta} \quad J_{v_i} = \begin{bmatrix} \frac{\partial \mathbf{p}_{C_1}}{\partial \theta_1} & \cdots & \frac{\partial \mathbf{p}_{C_i}}{\partial \theta_i} & \underbrace{\mathbf{0}}_{i+1} & \cdots & \underbrace{\mathbf{0}}_{n} \end{bmatrix} \\ & \omega_i = J_{\omega_i} \dot{\theta} \quad J_{\omega_i} = \begin{bmatrix} \overline{\varepsilon}_1 Z_1 & \cdots & \overline{\varepsilon}_i Z_i & \underbrace{\mathbf{0}}_{i+1} & \cdots & \underbrace{\mathbf{0}}_{n} \end{bmatrix} \\ & \therefore M = \sum_{i=1}^{N} \left( m_i J_{v_i}^T J_{v_i} + J_{\omega_i}^T I_{C_i} J_{\omega_i} \right) \\ & ! \text{ M is symmetric, positive definite } \therefore m_{ij} = m_{ji}, \dot{\mathbf{\theta}}^T M \dot{\mathbf{\theta}} > 0 \end{split}$$

# Generalized Coordinates A significant feature of the Lagrangian Formulation is that any convenient coordinates can be used to derive the system. Go from Joint → Generalized Define p: dp = Jdq q = [q<sub>1</sub> ... q<sub>n</sub>] → p = [p<sub>1</sub> ... p<sub>n</sub>] Thus: the kinetic energy and gravity terms become KE = ½ p<sup>T</sup>H\*p G\* = (J<sup>-1</sup>)<sup>T</sup>G where: H\* = (J<sup>-1</sup>)<sup>T</sup> HJ<sup>-1</sup>

# Also: Inverse Jacobian

• In many instances, we are also interested in computing the set of joint velocities that will yield a particular velocity at the end effector

$$\dot{\theta} = \mathbf{J}(\theta)^{-1} \dot{\mathbf{X}}$$

- We must be aware, however, that the inverse of the Jacobian may be undefined or singular. The points in the workspace at which the Jacobian is undefined are the *singularities* of the mechanism.
- Singularities typically occur at the workspace boundaries or at interior points where degrees of freedom are lost
